Adobe × CHITKARA UNIVERSITY

Release the Firefly.

Make something.
Find your people.

The idea.

A two-week campaign for students across Chitkara: make an image with Adobe Firefly, release it over a campus map, then meet people through what you make.

Where it started

The brief asked me to bring Adobe Firefly to campus. My first idea was a gallery of student work on a map. I then wanted the work to give people a reason to talk to someone from another school.

That became Make, Glow, Meet: make an idea visible, appreciate someone else's work, and join a small group to create something together. The campus is both the setting on screen and the place where people meet.

Make. Glow. Meet.

Make

Create in Adobe Firefly. Upload the image and its prompt, choose a building and a school swarm, then hold Release. Your work becomes a firefly on the map.

Glow

Open a firefly to see the image, prompt and maker. Glow work you enjoy. Appreciation is one-way, with no dislikes. Who gave a Glow stays private; the campaign board ranks Glows received.

Meet

Every night at 9 PM, the proposed campaign forms opt-in constellations of 3-5 people from different schools. Each gets a public campus spot and time. They make one piece together; it becomes a star.

One Glow per person per piece. First names and totals on the board, with an option to hide. On day 14, releases and Glows close; the final board remains, and the top ten are proposed for the Swarm Night projection.

Building the campus.

I supplied maps and photographs to Claude, then reviewed the web model against places I know. I corrected road layouts, entrances, building details, spacing and the night lighting.

Picasso

Square One

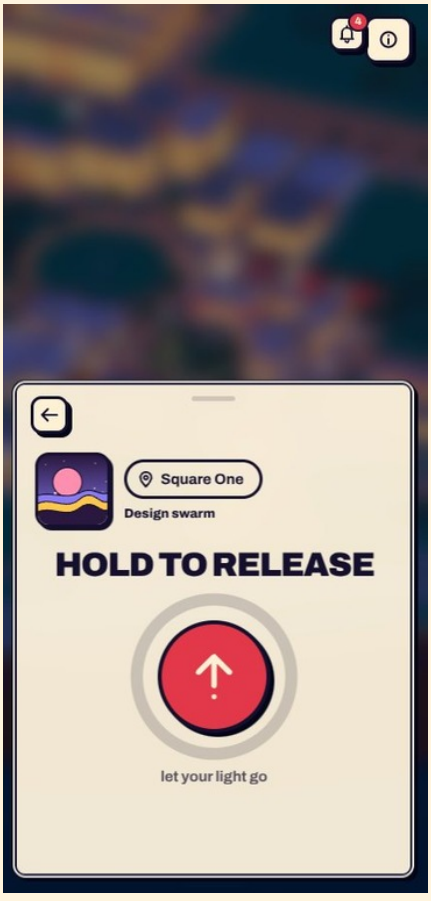

The result is a stylised Three.js model built with AI coding assistance from campus references. The geometry is constructed in code; the photos guide its appearance and layout.

Using the prototype.

A large Release button leads through image, prompt, spot and hold. The firefly flies from the button to its building. Work opens into a card; a Glow gives immediate visual feedback.

The public demo runs without sign-in. Visitors can explore, release a sample or their own image, and try the interactions. Uploads and Glows stay in their browser. Sample makers, totals, meetings and rewards demonstrate the intended campaign.

Hold to release

Four visual studies.

I kept a shared night palette across the artwork, campus and campaign: deep blue, warm windows and coloured light. These four illustrations are GPT-generated concept art, not Adobe Firefly output.

Square One

Posters on campus.

The launch poster introduces the campaign; the other two invite students to create or meet. Proposed spots include Square One, school corridors, the library and hostel noticeboards. QR codes lead to the campus demo.

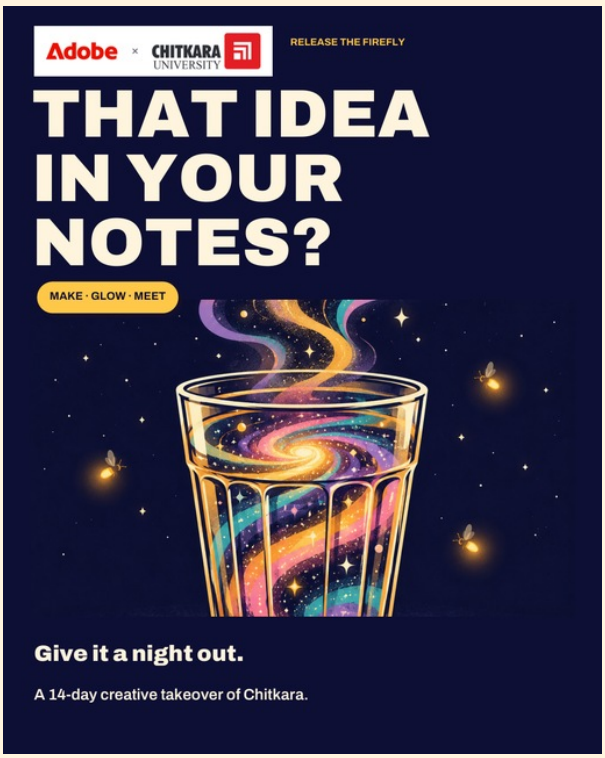

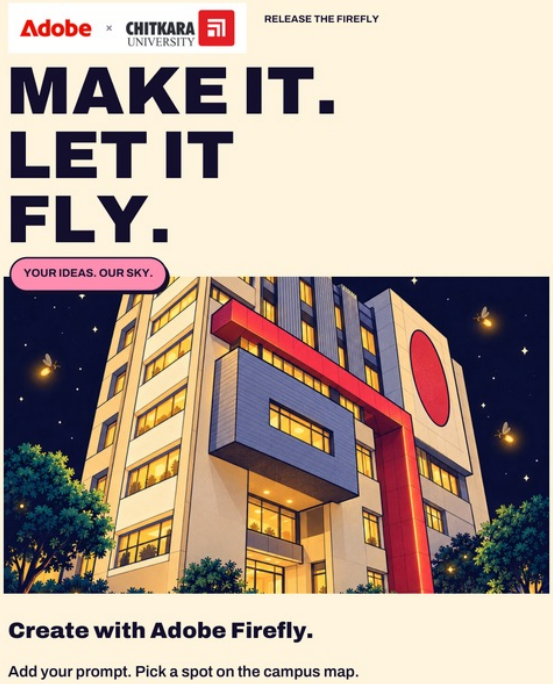

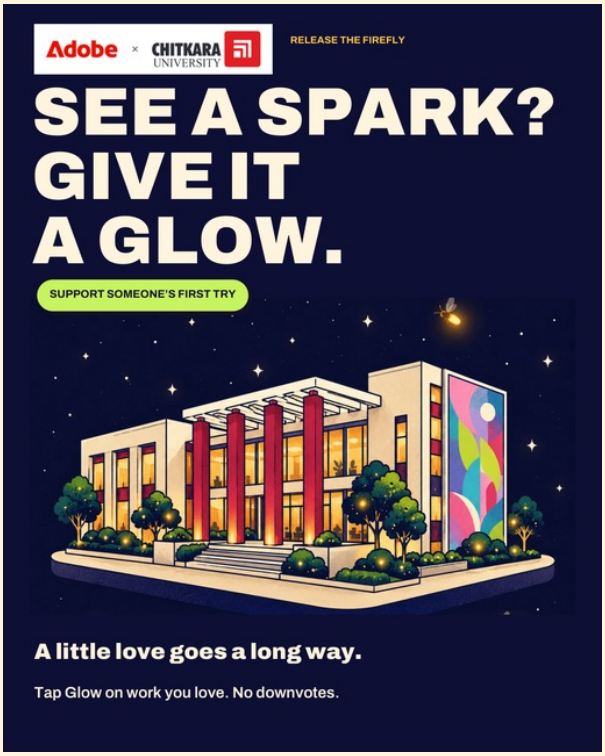

The invitation online.

A feed sequence explains the idea, shows a creation, introduces Glow and invites students to meet. Student work would be featured with permission during the two-week campaign.

At Square One. At Picasso.

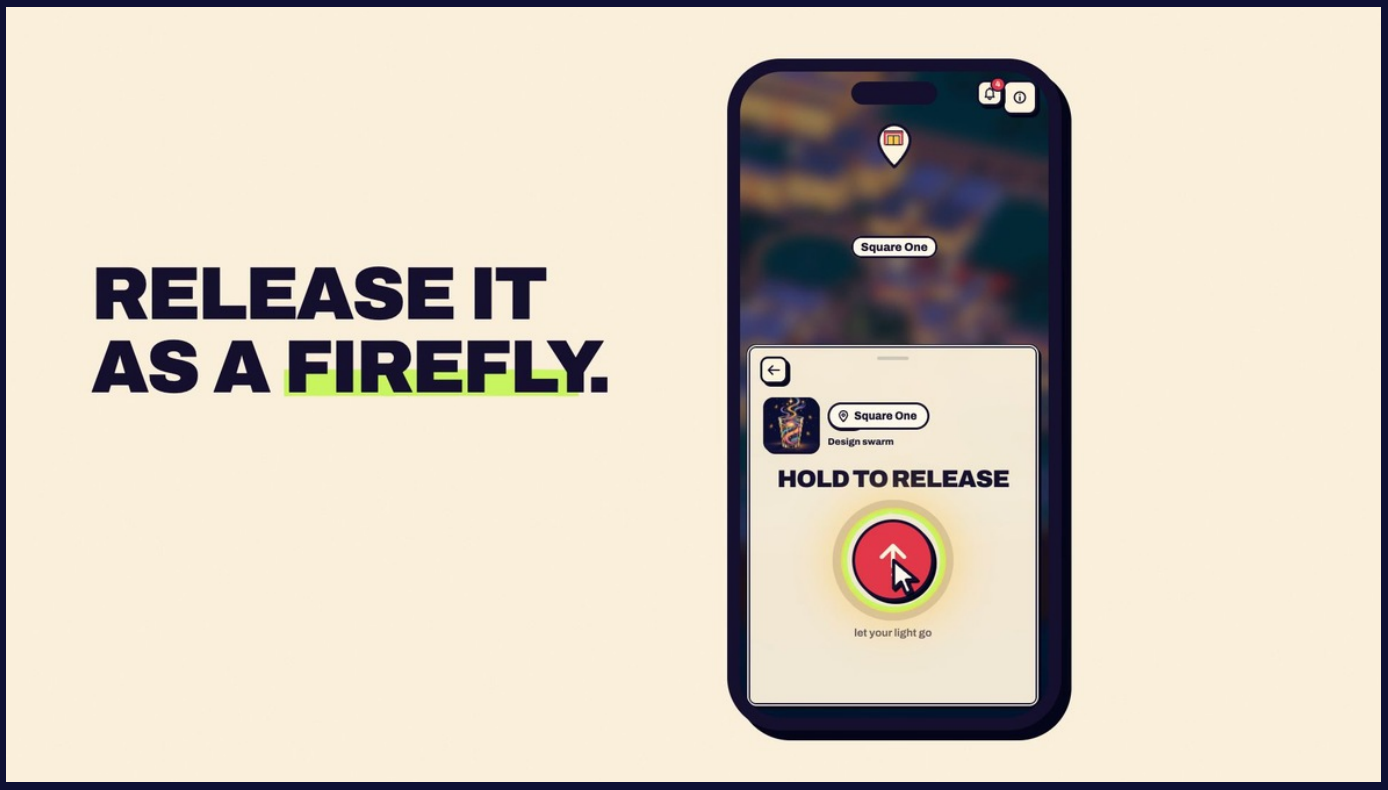

Placement studies show how the campaign could appear at a gathering place and on a campus facade. These are proposed temporary installations, with sizes and mounting to be agreed with campus staff.

The campaign film.

The full film explains the journey from an unfinished idea to making, releasing, Glowing and meeting. A separate 15-second edit gives a quick introduction. Both use the same campus, interface and voiceover.

Production: coded motion graphics using Remotion, existing illustrations and prototype screens. This is a concept promo, not a Firefly-generated video.

Two weeks on campus.

Days 1-3	Launch at Square One and school entrances with QR posters and short, hosted Firefly demos. Help students make their first image and attach the real prompt. Invite participation from every school.
Days 4-7	Feature student work with permission and explain Glow. Begin opt-in, mixed-school constellations at 9 PM, with a host and a clear public meeting spot. Keep the shared-making task small.
Days 8-13	Share collaborative pieces and invite new makers through their peers. Print selected corridor posters and collect permissions for the projection and zine. Check participation across schools and help underrepresented groups join.
Day 14	Host the proposed Swarm Night projection. Celebrate the top ten by Glows received, alongside collaborative work. Close new releases and Glows, keep the final board visible, and publish a consent-based archive.

What students can earn

Spark, Glow, Lantern and Beacon make progress visible. Proposed rewards include a story card, corridor poster, glow pin, projection, zine, certificate and portfolio review. Adobe perks remain tentative.

Responsible use

Use original or permission-cleared inputs, show the prompt, credit the maker, and ask before publishing names or work. Keep meetups optional and public. Track first creations, schools reached, return visits and collaborative pieces; report actual results after the campaign.

How I got here.

I used the conversations as a working process: supply references, prompt, inspect, correct and repeat. My campus photographs and feedback directed the model; the SVG kit and screen studies shaped the interface. The linked board holds the photo gallery, prompt excerpts and map studies.

Credits

Campaign, campus photography, design direction and review: Daksh Vasudeva. Campus model and integration: Claude-assisted Three.js code. Interface and illustrations: GPT-assisted design; the four art studies are GPT generations. Motion: coded with Remotion. Voiceover: supplied ElevenLabs Christina recording.

Production status

This PDF presents the complete campaign proposal, designed assets and an interactive demo. The campus activation and real student participation are proposed. The brief's Firefly-made hero, Firefly-made video and Adobe Firefly Board link have not been produced; the concept art, coded promo and process board do not replace those requirements.
