Adobe NEXT Campus Leaders challenge

Adobe × CHITKARA UNIVERSITY

Release the Firefly

Make something. Find your people.

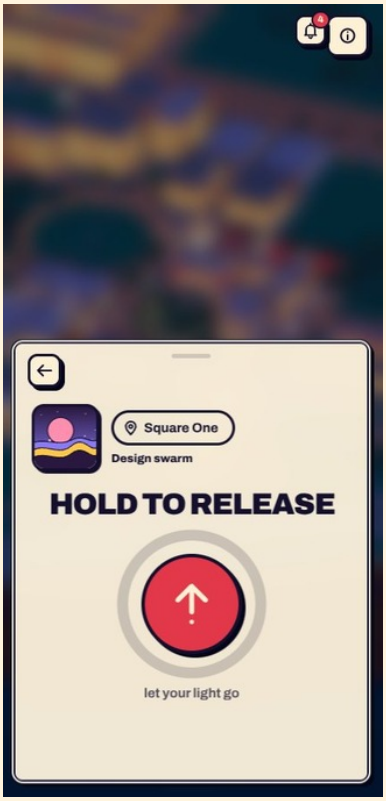

This two-week campaign invites students across Chitkara to create an image with Adobe Firefly, place it on a campus map and meet other students through their work.

I started with a gallery on a map. I then wanted it to give students a reason to talk to someone from another school. That became Make, Glow, Meet: students share an idea, appreciate someone else's work and make something together.

Open the app.

How students take part.

Students make.

Students upload their Firefly image and prompt. They choose a building and their school's colour group, called a swarm. Holding Release charges the firefly before it flies to the building.

Students give a Glow.

Students open a firefly to see the image, prompt and maker. They can give it a Glow to show appreciation. It is one-way, so nobody has to return it and there are no dislikes.

Students meet.

At 9 PM, the proposed campaign groups 3-5 students from different schools. It offers a public place and time. Joining is optional. The group makes one piece together, which becomes a star on the map.

The campaign board ranks Glows received. Each person can Glow a piece once. Only first names and totals are public, and students can hide from the board. Who gave a Glow stays private.

The current demo needs no sign-in. Uploads and Glows stay in each visitor's browser. Its people, totals, meetings and rewards are samples.

How I built it.

I gave Claude campus maps and my photographs, then checked the model against places I know. I corrected roads, entrances, building details, spacing and night lighting. Claude helped me build the Three.js model in code. I used the photos to guide its layout and appearance.

Picasso

Square One

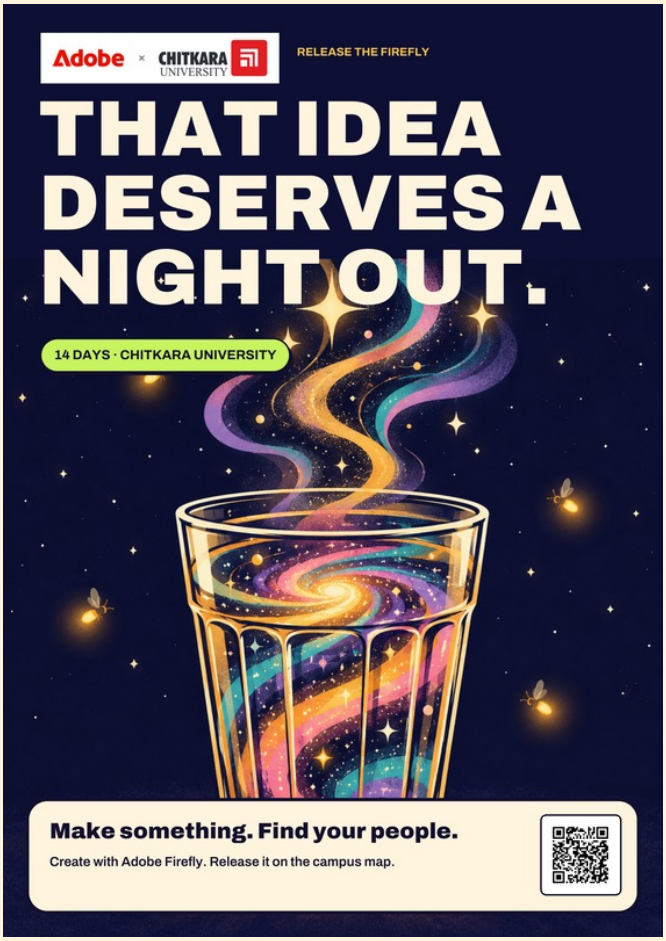

GPT helped me design the icons and screens. Claude helped connect them to the map. Cream panels, dark outlines, Archivo type and warm colours connect the app to the campaign.

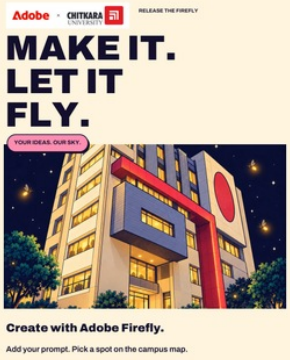

See the photographs, prompts and process board

The campaign on campus.

Three posters invite students to create, share and meet. Four feed cards explain the campaign online. The four GPT concept illustrations show a chai galaxy, Turing, Picasso and Square One. They are not Firefly outputs.

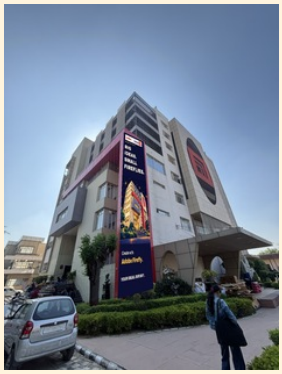

Open all posters and social artwork

The placement studies below show proposed hoardings at Square One and Picasso. Their sizes and mounting would be agreed with campus staff.

Watch the campaign.

The 51-second film explains the full journey. The 15-second cut gives a quick introduction. Both use the same campus, interface and voiceover.

Watch the full campaign film

Watch the 15-second cut

I directed and reviewed the campaign, photographed the campus and worked with AI tools on the design and code. The films use Remotion, the existing concept illustrations and an ElevenLabs Christina voiceover.

These concept films were made in code. The Firefly-made hero, Firefly video and Adobe Firefly Board link required by the brief are still missing. The demo and process board do not replace them.

The two-week plan.

Days 1-3	I will put QR posters at Square One, school entrances, the library and hostel noticeboards. Short Firefly demos would help students from every school make their first image and share its prompt.
Days 4-7	I will share student work with permission and explain Glow. At 9 PM, hosts would help opt-in groups meet at public campus spots and make one small piece together.
Days 8-13	I will share collaborative work, invite new makers and print selected corridor posters. I will collect permission for the projection and zine, and help schools with lower participation join in.
Day 14	I will hold Swarm Night and project the top ten by Glows received alongside collaborative work. New releases and Glows would close that night, while the final board and a consent-based archive would remain.

Students can earn rewards.

Spark, Glow, Lantern and Beacon would show progress. Proposed rewards include a story card, corridor poster, glow pin, projection, zine, certificate and portfolio review. Any Adobe perks would remain tentative.

Students keep credit for their work.

Students would use original or permission-cleared inputs, show their prompts and credit the maker. I will ask before publishing names or work and keep meetings optional and public. I will track first creations, schools reached, return visits and collaborative pieces, then report the actual results.
